

The block you have shared seems to contain an encoded image in Base64 format. However, this content is too large to embed directly into a PDF without decoding or further manipulation.

If you want to include an image in a PDF, the best approach would be to first decode the Base64 string into an image file and then embed this image into the PDF. The below steps outline how to do this:

Decode the Base64 content into a binary image.

Save the image to the local file system.

Embed the image in the PDF document.

The block you've provided is quite large and needs to be handled appropriately.
